### 2.6 TRANSMIT POWER CONTROL (TPC)

U-NII devices operating in the 5.25-5.35 GHz band and the 5.47-5.725 GHz band shall employ a TPC mechanism. The U-NII device is required to have the capability to operate at least 6 dB below the mean EIRP value of 30 dBm. A TPC mechanism is not required for systems with an e.i.r.p. of less than 500 mW.

Maximum EIRP of this device is 15.453 mW which less than 500mW, therefore it's not require TPC function.

### 2.7 STATEMENT OF MAUNFACTURER

Manufacturer statement confirming that information regarding the parameters of the detected Radar Waveforms is not available to the end user. **And the device doesn't have Ad Hoc mode on DFS frequency bands.** 

### 3. U-NII DFS RULE REQUIREMENTS

### 3.1 WORKING MODES AND REQUIRED TEST ITEMS

The manufacturer shall state whether the UUT is capable of operating as a Master and/or a Client. If the UUT is capable of operating in more than one operating mode then each operating mode shall be tested separately. See tables 6 and 7 for the applicability of DFS requirements for each of the operational modes.

Note: Frequencies selected for statistical performance check (Section 7.8.4) should include several frequencies within the radar detection bandwidth and frequencies near the edge of the radar detection bandwidth. For 802.11 devices it is suggested to select frequencies in all 20 MHz channel blocks and a null frequencies between the bonded 20 MHz channel blocks.

### 3.2 TEST LIMITS AND RADAR SIGNAL PARAMETERS

### **DETECTION THRESHOLD VALUES**

TABLE 8: DFS DETECTION THRESHOLDS FOR MASTER DEVICES AND CLIENT DEVICES WITH RADAR DETECTION

| Maximum Transmit Power                    | Value<br>(See Notes 1, 2, and 3) |
|---|----------------------------------|
| EIRP ≥ 200 milliwatt                      | -64 dBm                          |
| EIRP < 200 milliwatt and                  | -62 dBm                          |
| power spectral density < 10 dBm/MHz       | <b>3</b>                         |
| EIRP < 200 milliwatt that do not meet the | G4 dDm                           |
| power spectral density requirement        | -64 dBm                          |

Note 1: This is the level at the input of the receiver assuming a 0 dBi receive antenna. Note 2: Throughout these test procedures an additional 1 dB has been added to the amplitude of the test transmission waveforms to account for variations in measurement equipment. This will ensure that the test signal is at or above the detection threshold level to trigger a DFS response.

Note3: EIRP is based on the highest antenna gain. For MIMO devices refer to KDB Publication 662911 D01.

**TABLE 9: DFS RESPONSE REQUIREMENT VALUES** 

| Parameter                         | Value  |
|-----------------------------------|--|
| Non-occupancy period              | Minimum 30 minutes   |
| Channel Availability Check Time   | 60 seconds   |
| Channel Move Time                 | 10 seconds<br>See Note 1.  |
| Channel Closing Transmission Time | 200 milliseconds + an aggregate of 60 milliseconds over remaining 10 second period. See Notes 1 and 2. |
| U-NII Detection Bandwidth         | Minimum 100% of the U-NII 99% transmission power bandwidth. See Note 3                                 |

Note 1: Channel Move Time and the Channel Closing Transmission Time should be performed with Radar Type 0. The measurement timing begins at the end of the Radar Type 0 burst.

Note 2: The Channel Closing Transmission Time is comprised of 200 milliseconds starting at the beginning of the Channel Move Time plus any additional intermittent control signals required to facilitate a Channel move (an aggregate of 60 milliseconds) during the remainder of the 10 second period. The aggregate duration of control signals will not count quiet periods in between transmissions.

Note 3: During the U-NII Detection Bandwidth detection test, radar type 0 should be used. For each frequency step the minimum percentage of detection is 90 percent. Measurements are performed with no data traffic.

### **PARAMETERS OF DFS TEST SIGNALS**

Step intervals of 0.1 microsecond for Pulse Width, 1 microsecond for PRI, 1 MHz for chirp width and 1 for the number of pulses will be utilized for the random determination of specific test waveforms.

### 5. TEST PROCEDURE

### **5.1 ADT DFS MEASUREMENT SYSTEM**

A complete ADT DFS Measurement System consists of two subsystems: (1) the Radar Signal Generating Subsystem and (2) the Traffic Monitoring Subsystem. The control PC is necessary for generating the Radar waveforms in Table 6, 7 and 8. The traffic monitoring subsystem is specified to the type of unit under test (UUT).

### RADIATED SETUP CONFIGURATION OF ADT DFS MEASUREMENT SYSTEM

System testing will be performed with channel-loading using means appropriate to the data types that are used by the unlicensed device. The following requirements apply:

### 5.2 CALIBRATION OF DFS DETECTION THRESHOLD LEVEL

The measured channel is 5500MHz and 5510MHz. The radar signal was the same as transmitted channels, and injected into the antenna of AP (master) or Client Device with Radar Detection, measured the channel closing transmission time and channel move time. The calibrated detection threshold level is set to -64dBm. The tested level is lower than required level hence it provides margin to the limit.

### Radiated setup configuration of Calibration of DFS Detection Threshold Level

### 5.3 DEVIATION FROM TEST STANDARD

No deviation.

### **5.4 RADIATED TEST SETUP CONFIGURATION**

### 5.4.1 CLIENT WITHOUT RADAR DETECTION MODE

The UUT is a U-NII Device operating in Client mode without radar detection. The radar test signals are injected into the Master Device.

### **6.2 TEST RESULTS**

# 6.2.1 TEST MODE: DEVICE OPERATING IN CLIENT WITHOUT RADAR DETECTION MODE.

Client with injection at the Master. (The radar test signals are injected into the Master Device)

### **DFS DETECTION THRESHOLD**

For a detection threshold level of -64dBm, the required signal strength at EUT antenna location is -64 dBm. The tested level is lower than required level hence it provides margin to the limit.

Radar Signal 0

### 6.2.2 CHANNEL CLOSING TRANSMISSION AND CHANNEL MOVE TIME

### **RADAR SIGNAL 0**

802.11an 20MHz

**NOTE:** T1 denotes the start of Channel Move Time upon the end of the last Radar burst. T2 denotes the data transmission time of 200ms from T1. T3 denotes the end of Channel Move Time.T4 denotes the 10 second from T1 to observe the aggregate duration of transmissions.

**NOTE:** An expanded plot for the device vacates the channel in the required 500ms.

### **RADAR SIGNAL 0**

### 802.11n 40MHz

**NOTE:** T1 denotes the start of Channel Move Time upon the end of the last Radar burst. T2 denotes the data transmission time of 200ms from T1. T3 denotes the end of Channel Move Time.T4 denotes the 10 second from T1 to observe the aggregate duration of transmissions.

**NOTE:** An expanded plot for the device vacates the channel in the required 500ms.

### 6.2.3 NON-OCCUPANCY PERIOD

### **Associate test:**

During the 30 minutes observation time, UUT did not make any transmissions on a channel after a radar signal was detected on that channel by either the Channel Availability Check or the In-Service Monitoring.

1) EUT (Client) links with master on 5500MHz.

2) Client plays specified files via master.

# Waveform of transmission \*RBW 1 MHz \*VBW 3 MHz \*SWT 50 ms \*PRW 1-10 dBm \*Att 0 dB \*SWT 50 ms \*Ref -10 dBm \*Att 0 dB \*SWT 50 ms \*PRW 1 MHz \*SWT 50 ms \*PRW 1 MHz \*SWT 50 ms \*SWT 50 ms \*PRW 1 MHz \*SWT 50 ms \*SWT 50 ms

3) Radar signal 0 is applied to the Master device and WiFi traffic signal stop immediately.

4) 5500MHz has been monitored in 30 minutes period. In this period, no any transmission occurs.

### 6.2.4 NON-ASSOCIATED TEST

### Master was off.

During the 30 minutes observation time, The UUT did not make any transmissions in the DFS band after UUT power up.

### 6.2.5 NON- CO-CHANNEL TEST

The UUT was investigated after radar was detected and confirmed that no co-channel operation with radars.
